LECTURES
Friday 14h-16h in RAČUNALNI PRAKTIKUM

EXERCISES
Field and lab work (RAČUNALNI PRAKTIKUM)

EXAM = SEMINAR

GRADING

LECTURES

Participation : minimally at 7 lectures

EXERCISES

mandatory (one absence is ok)
field work is a part of excercises

COURSE CONTENT

1. Introduction to crustacean biology (historical overview, diversity, success, similarities of, and the differences between crustaceans and other arthropods).
2. Systematic and evolution of crustaceans
3. Crustacean phylogeny
4. Comparative anatomy and morphology of class Remipedia
5. Comparative anatomy and morphology of class Cephalocarida
6. Comparative anatomy and morphology of class Branchiopoda
7. Comparative anatomy and morphology of class Maxillopoda
8. Comparative anatomy and morphology of class Malacostraca
9. Biology and ecology of gammarid species in Croatia
10. Reproduction, life cycles and crustacean behaviour
11. Microbiology, epibionts, diseases and crustacean aquaculture
12. Invasive crustaceans in Europe
13. Crustacean conservation, management and legislation
14. Ecological characteristics of freshwater crayfish in Croatia
15. Vulnerability and protection of the family Astacidae in Europe

no.	date	topic	note
1.	11.10.2024.	Into lecture	Prof. dr. sc. Sanja Gottstein & Prof. dr. sc. Ivana Maguire
x.10.2024.		fieldwork 1 – Medvednica / Podsused + labwork	Prof. dr. sc. Sanja Gottstein & Prof. dr. sc. Ivana Maguire
x. 10.2024.		fieldwork 2 – Maksimir + labwork	Prof. dr. sc. Sanja Gottstein & Prof. dr. sc. Ivana Maguire
2.	18.10.2024.	Crustacean systematics, taxonomy and phylogeny	Prof. dr. sc. Ivana Maguire & Prof. dr. sc. Sanja Gottstein
3.	25.10.2024.	classes: Remipedia & Cephalocarida	Prof. dr. sc. Sanja Gottstein
4.	8.11.2024.	class Branchiopoda	Prof. dr. sc. Ivana Maguire
5.	15.11.2024.	Partial exam II	
6.	22.11.2024.	class Maxillopoda1 – MYSTACOCARIDA, COPEPODA, OSTRACODA	Prof. dr. sc. Sanja Gottstein
7.	6.12.2024.	class Maxillopoda2 – THECOSTRACA, TANTULOCARIDA, BRANCHIURA, PENTASTOMIDA	Prof. dr. sc. Ivana Maguire
8.	13.12.2024.	class Malacostraca1 – LEPTOSTRACA, HOPLOCARIDA, SYNCARIDA, EUCARIDA	Prof. dr. sc. Ivana Maguire
9.	20.12.2024.	class Malacostraca 2 - supraclass Peracarida	Prof. dr. sc. Sanja Gottstein
10.	10.1.2025.	Biology and ecology of gammarids in Croatia	Prof. dr. sc. Sanja Gottstein
11.	17.1.2025.	Microbiology, epibionts, diseases, invasive crustaceans, aquaculture	Prof. dr. sc. Ivana Maguire
12.	24.1.2025.	Reproduction, life cycles and behaviour of crustaceans conservation, management, law	Prof. dr. sc. Sanja Gottstein
13.	31.1.2025.	Partial exam II	

EXERCISES include:

field work (different sampling methods, fixation, documentation and determination of the crustaceans)

lab work (analyses of samples and data from the field, crustacean behaviour).

- **FIELD WORK**

	LOCATIONS	TIME
1.	Field trip to the Medvednica Mt. (Dolje Stream, subthermal source (Sutinska vrela) and aquifer of the Sava valley (Podsused)) + krenal (Northon pump)	19.10. 2024.
2.	Maksimir lakes' crustaceans– plankton & LiNi traps	26.10. 2024.

- LAB work

	What?	When?
1.	Crayfish determination	? .10.2024.
2.	Determination of crustaceans from Sutinska vrela freatika	? .10.2024.
3.	Analysis of crustaceans' density in the plankton samples	? .10.2024.

LEARNING OUTCOMES

1. Explaining the characteristics contributing to the diversity of crustaceans and their success to inhabit various ecosystems.
2. Defining the anatomical similarities of, and the differences between crustaceans and other arthropods.
3. Identifying and explaining the key morphological differences of each crustacean group.
4. Comparing external and internal crustacean anatomy.
5. Implementing various laboratory and field methods that are related to collecting, preparing, documenting and determining different crustacean.
6. Explaining the survival, reproduction and life strategy of different crustacean groups.
7. Describing the applications of crustacean ecology to conservation, wildlife management and legislation.

Collections – museums and private

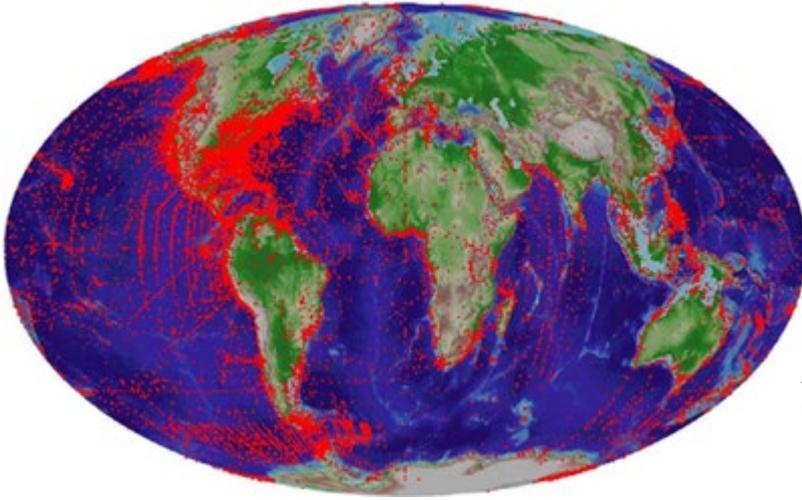

- Natural history museum Los Angeles, USA

- 4th (size-wise) in the world
- 140 000 “pickled” jars (estimation - 5 mil. samples)
- east Pacific, Indian and Antarctic oceans and Caribbean sea
- marine, freshwater and terrestiral crustaceans

• Smithsonian National Museum of Natural history-Washington, USA

Global diversity of the National Invertebrate Collections (red dots indicate localities of IZ collections)

A drawing by Giesbrecht (1892) of the Copepoda, *Sapphirina auronitens* Claus, 1863

NATIONAL
MUSEUM of
NATURAL
HISTORY

DEPARTMENT OF

Invertebrate Zoology

1,934,364 crustacea in collection

• The Queensland Museum (Australia)

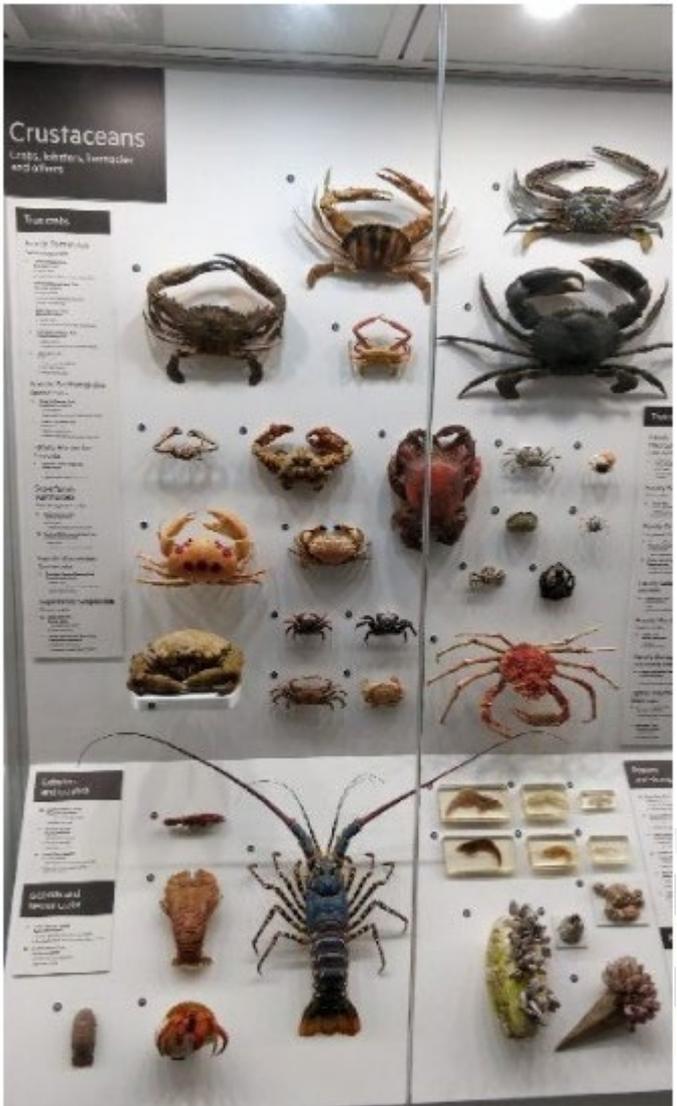

- 48 122 crustaceans
- due to climate and habitat this part of Australia is the most diverse (both marine and freshwater crustaceans)

Crustaceans collections

Queensland has the highest diversity of marine and terrestrial crustaceans in Australia. This is due to the rich diversity of habitats in tropical and subtropical climates. The collection contains:

- about 27,000 registered specimen lots, about 9,000 unregistered;
- over 1400 type specimens;
- strengths in decapods (crabs, shrimps, lobsters and their relatives);
- Indo-West Pacific mangrove and shore crabs; one of the most comprehensive in the world, and includes almost all Australian species;
- about 75% of the collection is databased.

Trapezia septata

- **Iziko South African Museum (JAR)**
- **Crustacean Collection**

- the biggest crustacan collection in Africa
-5101 samples from 274 crustacean families

Crustacean Collections

Iziko South African Museum houses the most important crustacean (crabs, lobsters, shrimps, barnacles) collection in South Africa. Significant past contributions were made by K.H. Barnard, J.R. Grindley and B.F. Kensley (Crustacea).

Land crab

African Decapoda Crustacea collection - MUHNAC

Published by [National Museum of Natural History and Science, University of Lisbon](#)

The collection of African decapod crustaceans is part of the Crustacea collection of the Museu Nacional de História Natural e da Ciência, Universidade de Lisboa. It comprises 1114 accessions, which correspond to about 4528 specimens of decapod crustaceans belonging to 86 families.

• **Raffles museum of biodiversity research, Singapur (Asia)**

- decapode crustacean collection (along with National Museum of Japan i the Zoological Survey of India)

- collection was made during '50-'70 (terrestrial, deep sea)

- cca 22000 specimens (1 200 species)

- **Natural history museum in Rijeka**

- the crustacean collection, like the other collections of the Rijeka Natural History Museum, is based on the material of the Hungarian Royal Biological Station (around 200 inventory numbers)

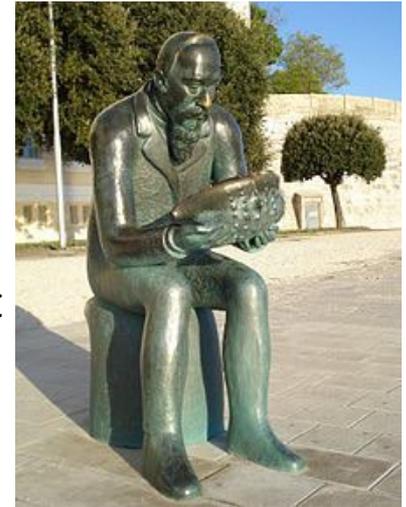

- **Natural history museum in Zagreb**

- the permanent exhibition dates from the middle of the 19th century (systematic exhibition + depot of teaching materials) and contains a collection of crustaceans

- **Zavičajni muzej / Homeland museum Obrovac**

- the permanent exhibition "On the trail of young Brusina through the Obrovac region" through photos, text, cave drawings and exhibition specimens of land snails and **freshwater crayfish** shows the scientific journey and research of the wider Obrovac area of the young scientist back in 1863.

- **Narodni muzej / National museum Zadar**

-the crustacean collection consists of dry and permanent wet preparations. For the most part, it is material collected in the last ten years. The oldest specimens, for which there is information about the place and date of discovery, date from 1969.

- **Natural history museum Dubrovnik**

Crayfish blues - I just want to moult

http://photo.dastrand.com/2013/10/crayfish-blues-i-just-want-to-moult_13.html

Crayfish blues – I just wanna moult

Lyrics by Stephanie Peay

Vocals & Harmonica by Lennart “Lelle” Edsman

Guitar by Thomas Abeel

I woke up this morning
It wasn't my fault
My baby don't get it
Yeah, I just wanna moult
I just wanna moult
I just wanna moult
I needed to scratch it
I knew I should catch it
Perhaps I should patch it
But I felt like a dolt
Yeah, I felt like a dolt
I'm too big for my britches
It scratches and itches
Bring on that ecdysis
I'm falling to pieces
Oh just let me moult
Oh just let me moult
Aaaaaaaaaaaaaaaaaaaaaahhh!!

Yeah, moult for me baby!!

COMMENTS ON CRUSTACEAN BIODIVERSITY AND DISPARITY OF BODY PLANS

Frederick R. Schram

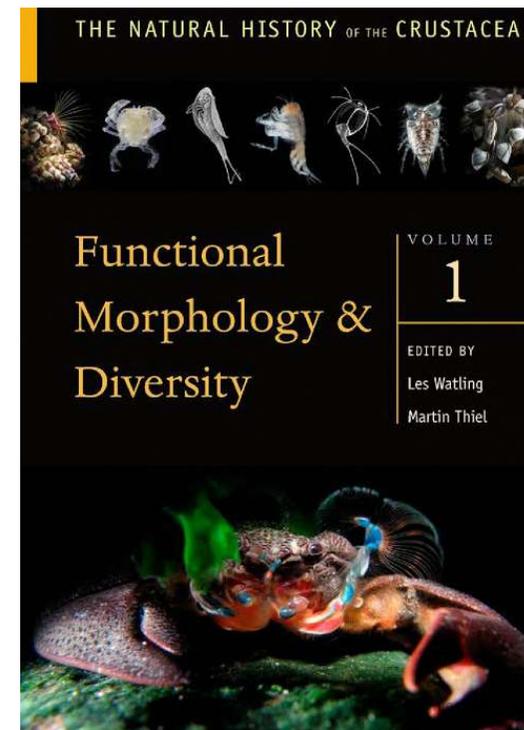

Abstract

The science of natural history is built on twin pillars: cataloging the species found in nature, and reflecting on the variety and function of body plans into which these species fit. We often use two terms, *diversity* and *disparity*, in this connection, but these terms are frequently used interchangeably and thus repeatedly confused in contemporary discourse about issues of function and form. Nevertheless, diversity and disparity are distinct issues and must be treated as such; each influences our views of the evolution and morphology of crustaceans.

CRUSTACEAN DIVERSITY

Crustaceans exhibit great disparity in basic body plans (I return to this subject below), but disparity of crustacean form is different from crustacean biodiversity, that is, the number of species we have within any particular group. No one knows for certain the exact number of species within any group of organisms, although the situation might improve with the appearance of online catalogs for particular groups. The people who set up these databases and maintain them as new species are added and old species are placed in synonymy provide a much-needed service toward adequately cataloging the tree of life. Nevertheless, as humans we like numbers—they are easily understood. So I have made my own tally (Table 1.1) and present a summary of estimates compiled from various authorities as to the total number of crustacean species.

There is clearly no agreement on numbers among the authors listed in Table 1.1, although the estimates have gone up through time. With the exception of Minelli (1993) and Brusca and

CLASSIFICATION OF CRUSTACEA

- 5 CLASSES:

Remipedia (12 sp.)

Cephalocarida (9 sp.)

Branchiopoda (10,000 sp.)

Malacostraca (20,000 sp.)

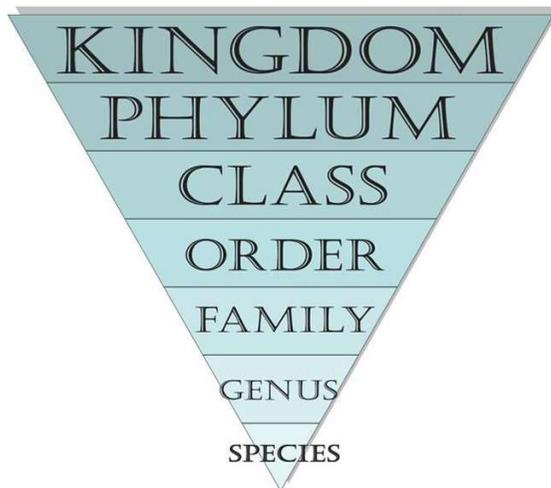

Maxillipoda (10,000 sp.)

(Martin & Davis 2001)

CRUSTACEANS are...

LEVEL OF CLASSIFICATION

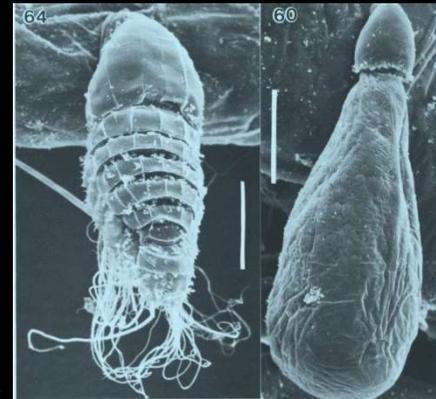

- ✓ A **class** of **arthropods** which **breathes by gills** or similar structures, and have bodies which are covered by a **hard shell or crust**.
- ✓ A **group** of **mostly aquatic arthropods** ...
- ✓ A **large group** of **aquatic organisms** that fish eat.
- ✓ A **large subphylum** Crustacea often with a **hard shell**.
- ✓ **Large class** of **animals**, mostly **aquatic**, with **hard shells**.
- ✓ Includes many **microscopic organisms**...
- ✓ A **group** of **hard-shelled invertebrates** ...
- ✓ A **large class** of **animals**, usually living in or near the **water**, that have a **hard crustlike outer covering** (exoskeleton).
- ✓ **Water animals** with an **outside skeleton or shell**.
- ✓ A **group** of predominately **aquatic animals** including crabs, shrimps, and barnacles, having **hard outer skeletons or shells, and paired, jointed, limbs**.
- ✓ **Organisms**, generally **aquatic**, characteristically having a **segmented body, a hard external covering, and paired jointed limbs**
- ✓ **Aquatic invertebrates**, that have **segmented bodies, jointed legs, and exoskeletons**
- ✓ **Invertebrates** characterized by a **hard outer shell and jointed appendages and bodies**.
- ✓ ...

We can be both very big and very small!

Morphology

Size

100 μm

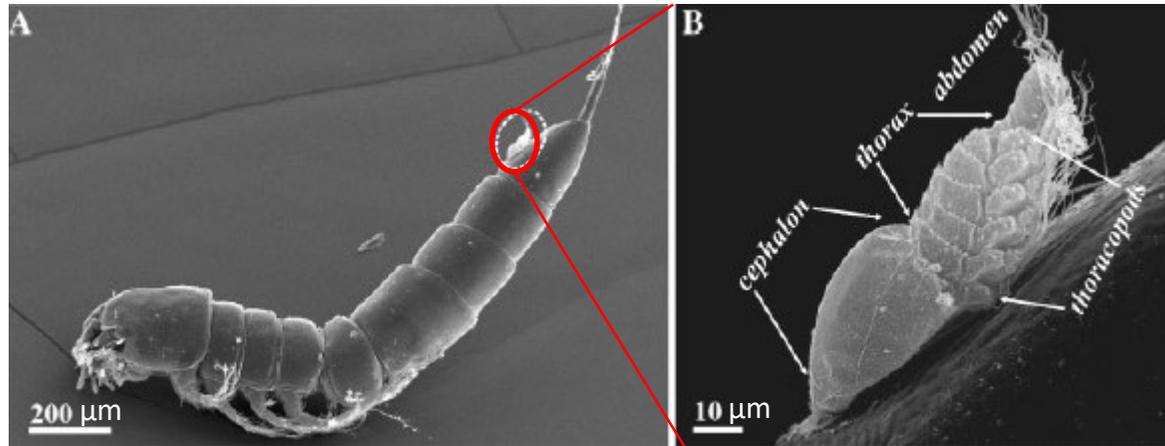

Tantulocarida

4 m

Pseudocarcinus gigas

WHICH IS THE SMALLEST CRUSTACEANS IN THE WORLD?

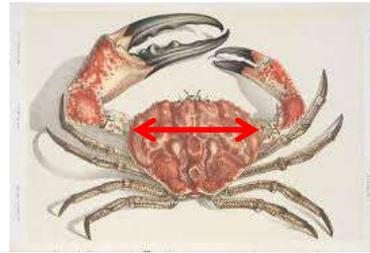

Harpacticoida

Tantulocarida

Ectoparasite crustacean species *Serratotantulus chertoprudae* on the copepod crustacean Harpacticoida

Savchenko i Kolbasov 2009. *Serratotantulus chertoprudae* gen. et sp. n. (Crustacea, Tantulocarida, Basipodellidae): A new tantulocaridan from the abyssal depths of the Indian Ocean. *Integrative and Comparative Biology*, 49, 2: 106–113.

WHICH IS THE LARGEST CRUSTACEAN IN THE WORLD?

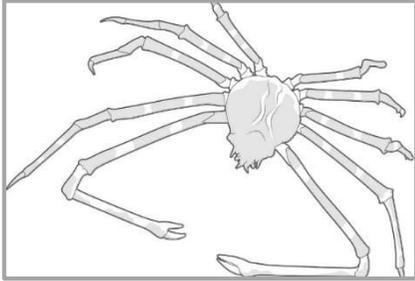

46 cm

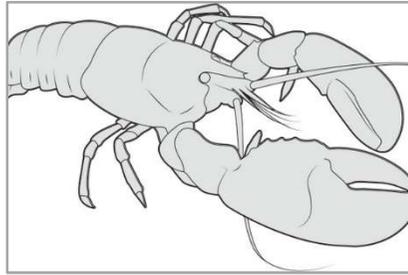

Pseudocarcinus gigas (Lamarck, 1818) – Tasmanian giant crab

GIANTS

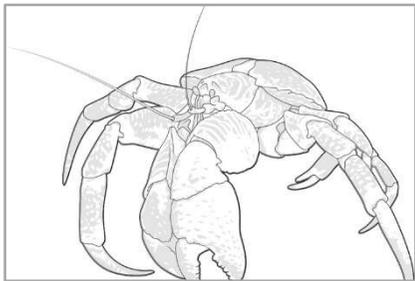

1. *Macrocheira kaempferi* – diameter of legs 4 m

2. *Homarus americanus* – body lengths 1 m

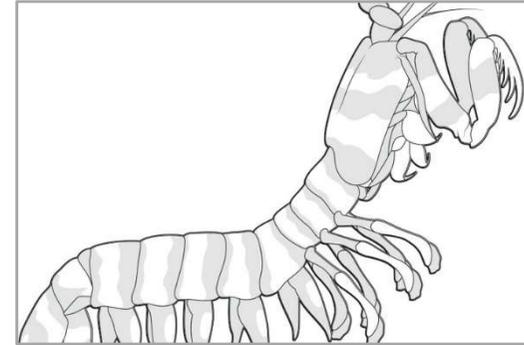

3. *Birgus latro* – diameter of legs 1 m

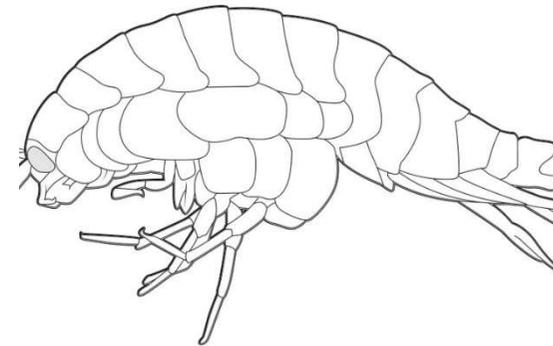

4. *Pseudocarcinus gigas* – diameter of legs 80 cm

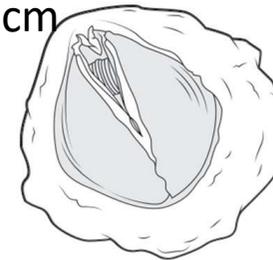

5. *Lysiosquilla maculata* – length 40 cm

6. *Alicella gigantea* – length 34 cm

7. *Balanus nubilus* – diameter of body 30 cm

DEEP SEA GIGANTISM

ISOPODA

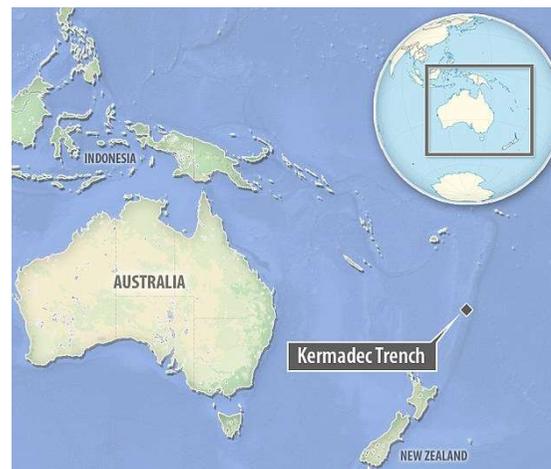

Bathynomus giganteus

4194m-5281m depth

AMAZING DIVERSITY OF HABITUS

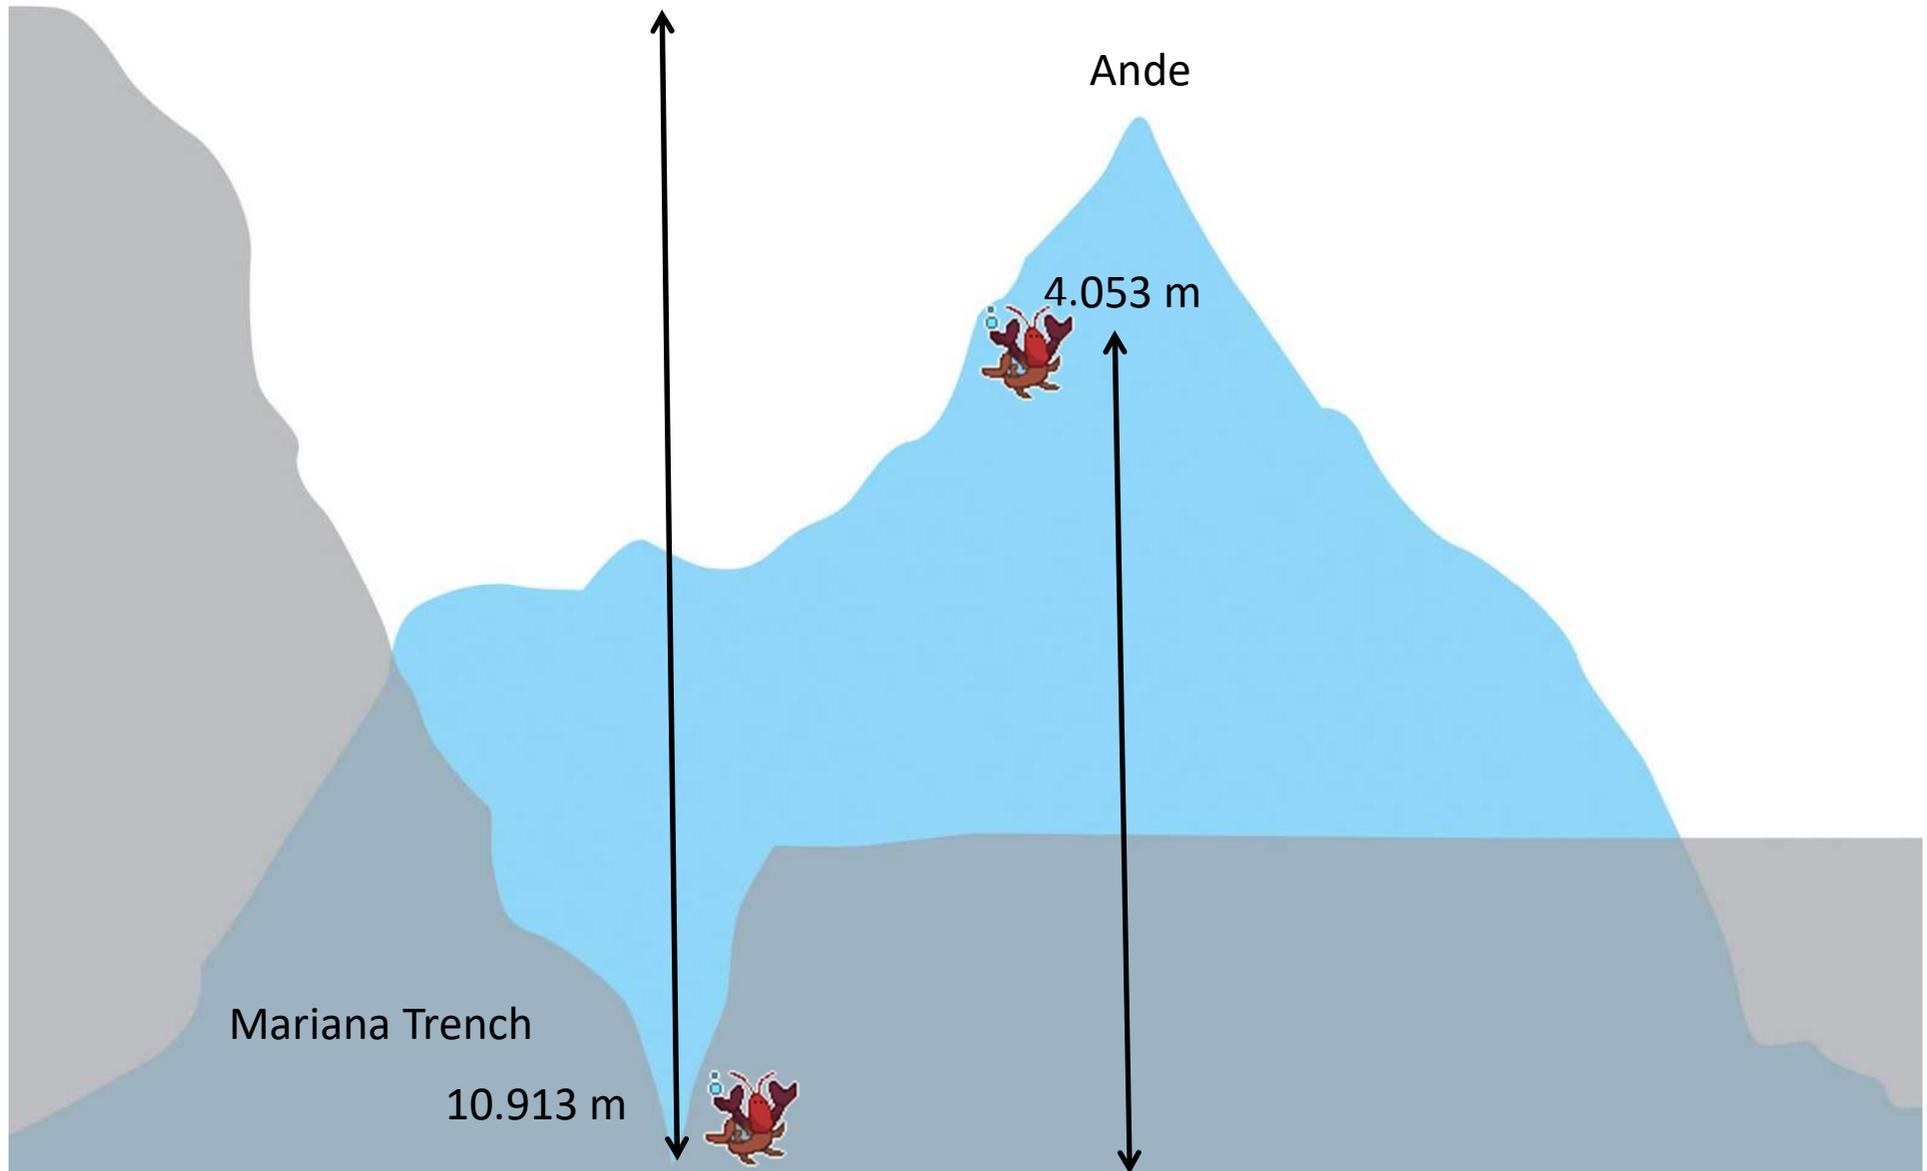

AMAZING BEAUTY

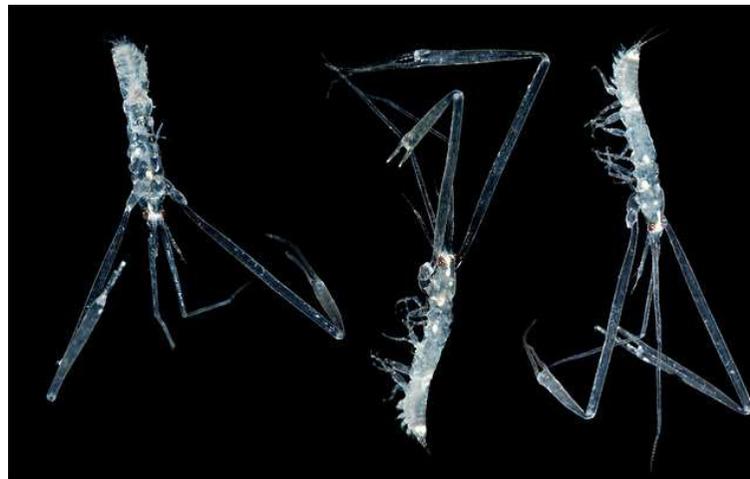

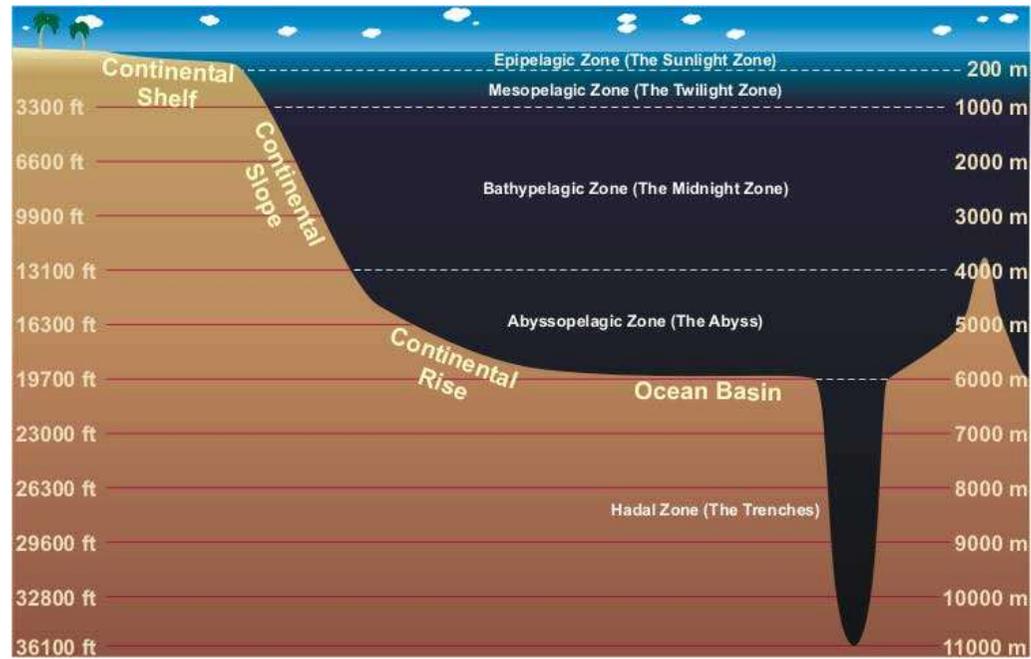

AMPHIPODA – ALIENS AMONG CRUSTACEANS

THEY ARE DISTRIBUTED EVERYWHERE

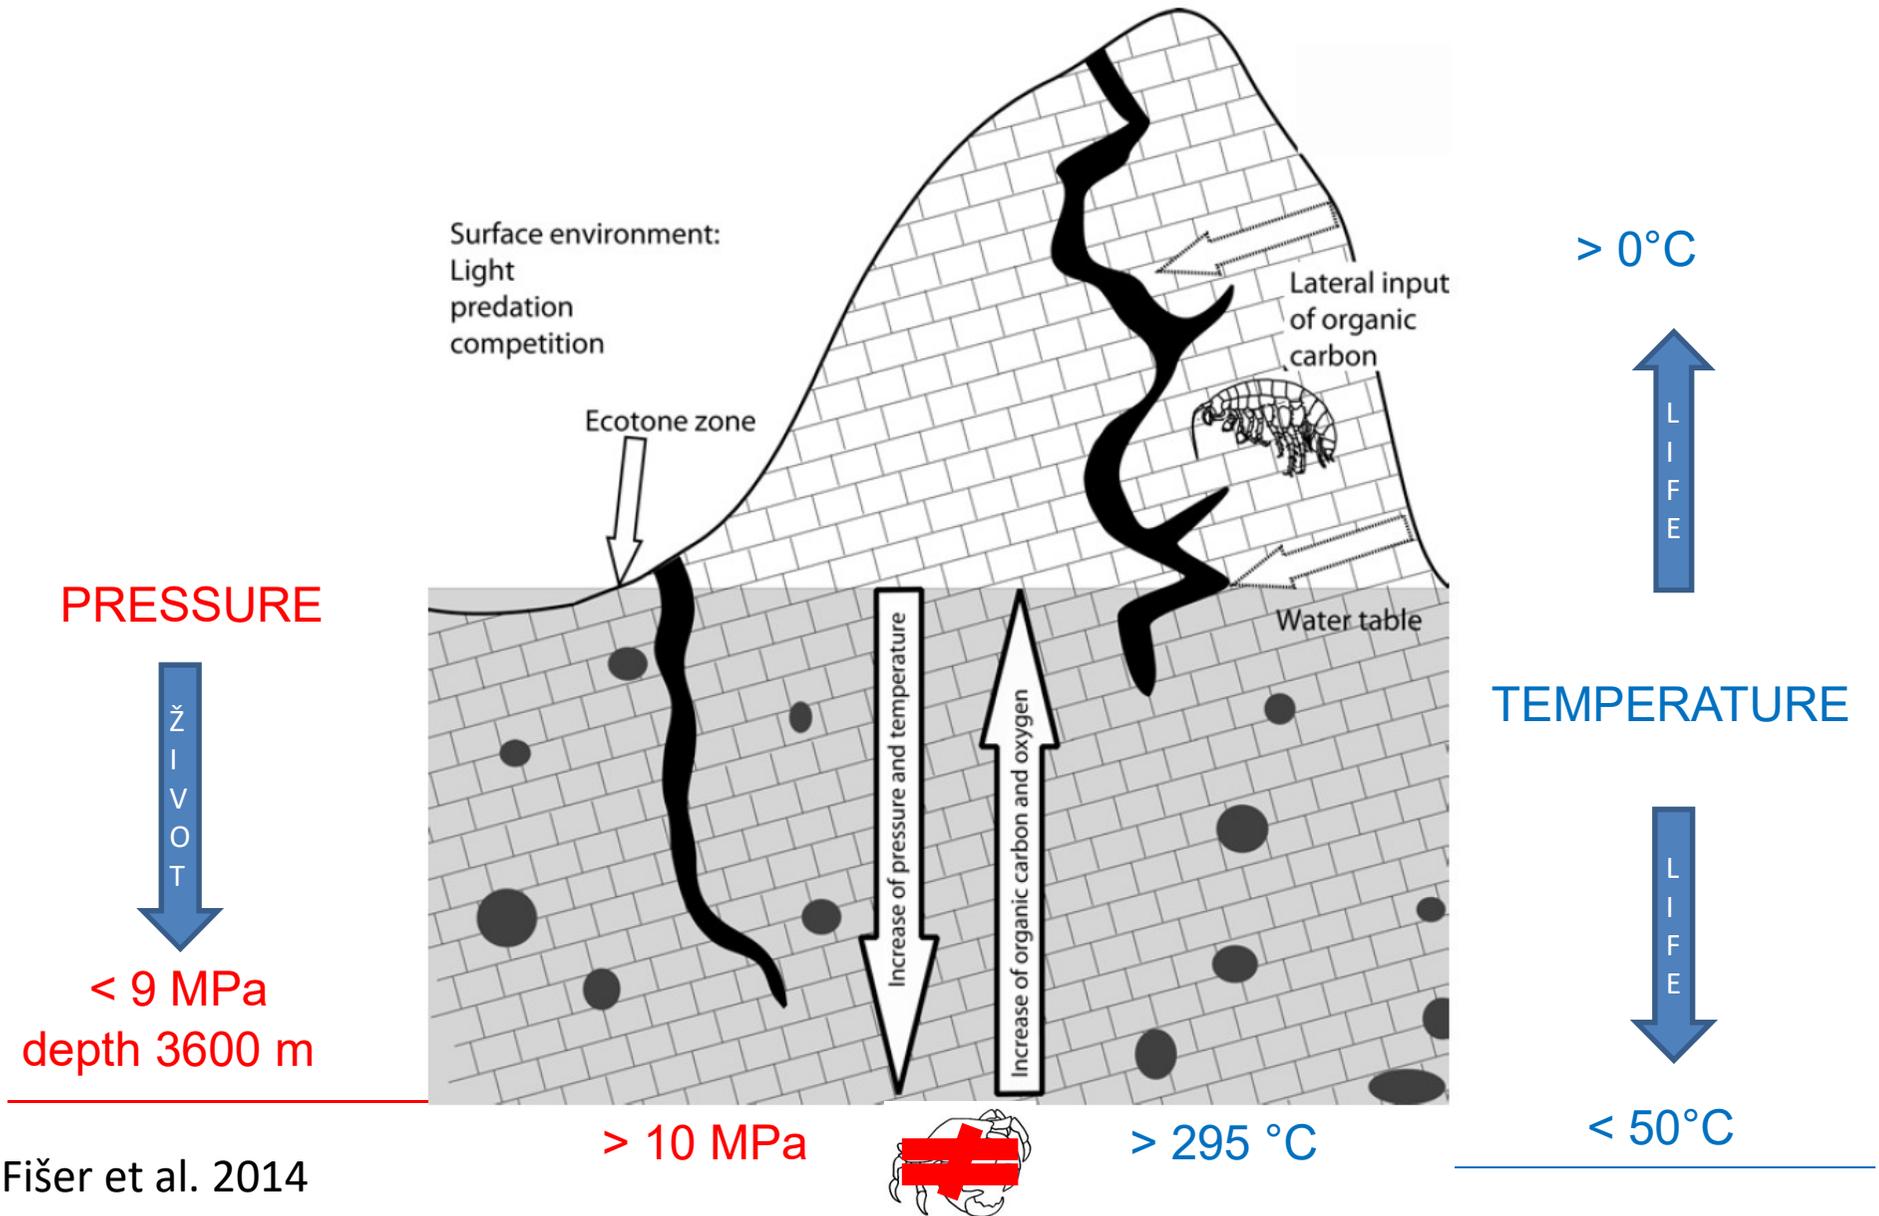

FROM THE BOTTOM OF THE DEEP OCEANS

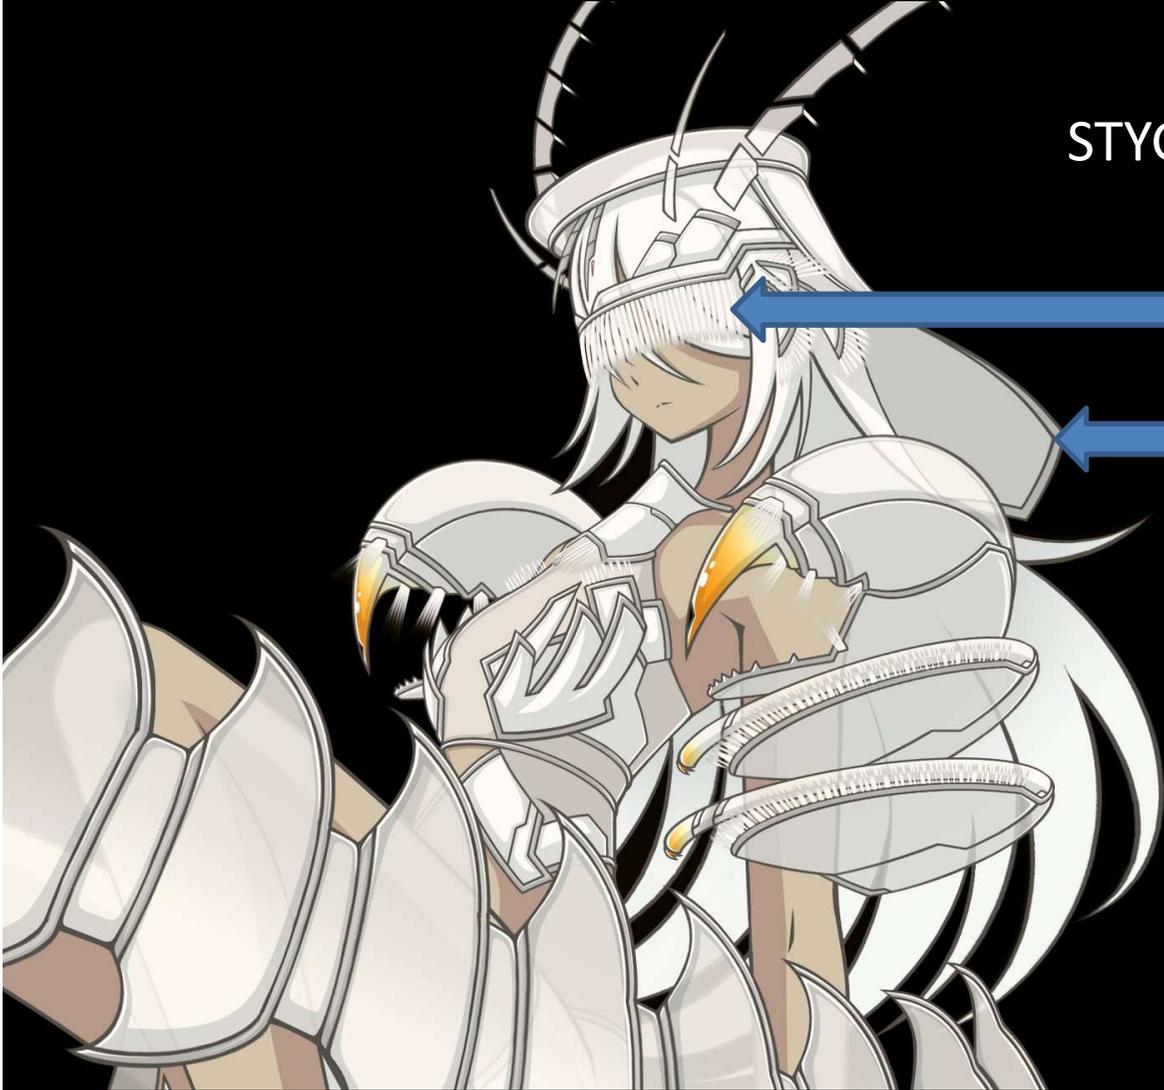

Leptochelia longimana

TO WHICH EXTREMES OF UNDERGROUND HABITATS?

STYGOBITIC CRUSTACEANS

EYELESS

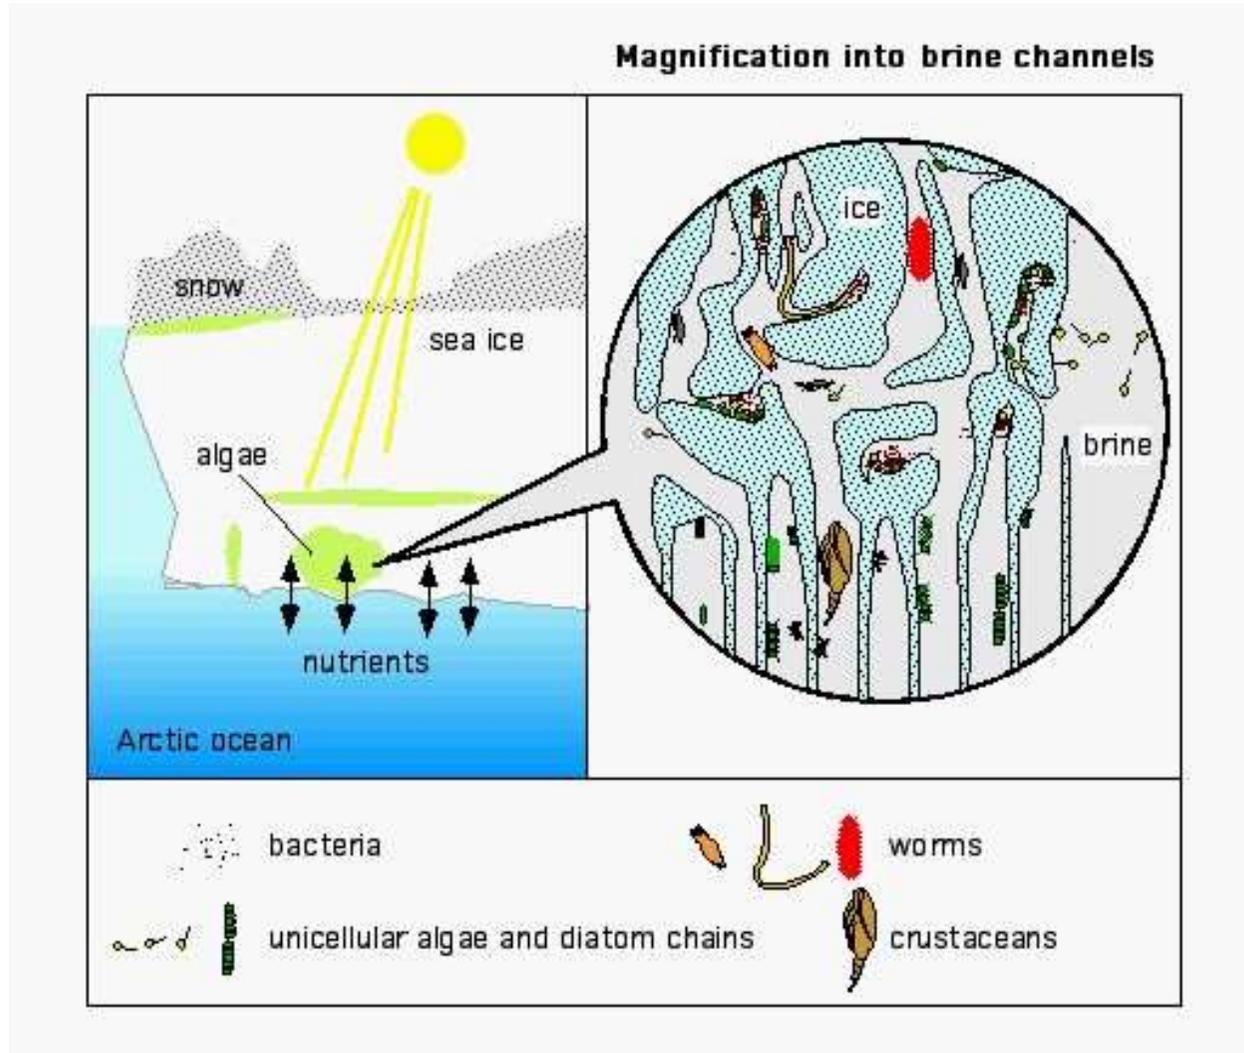

DEPIGMENTED

can live frozen in ice for several hours

EVEN IN ICE SANTs!!!

CRUSTACEAN BIOMASS IN THE OCEANS !?

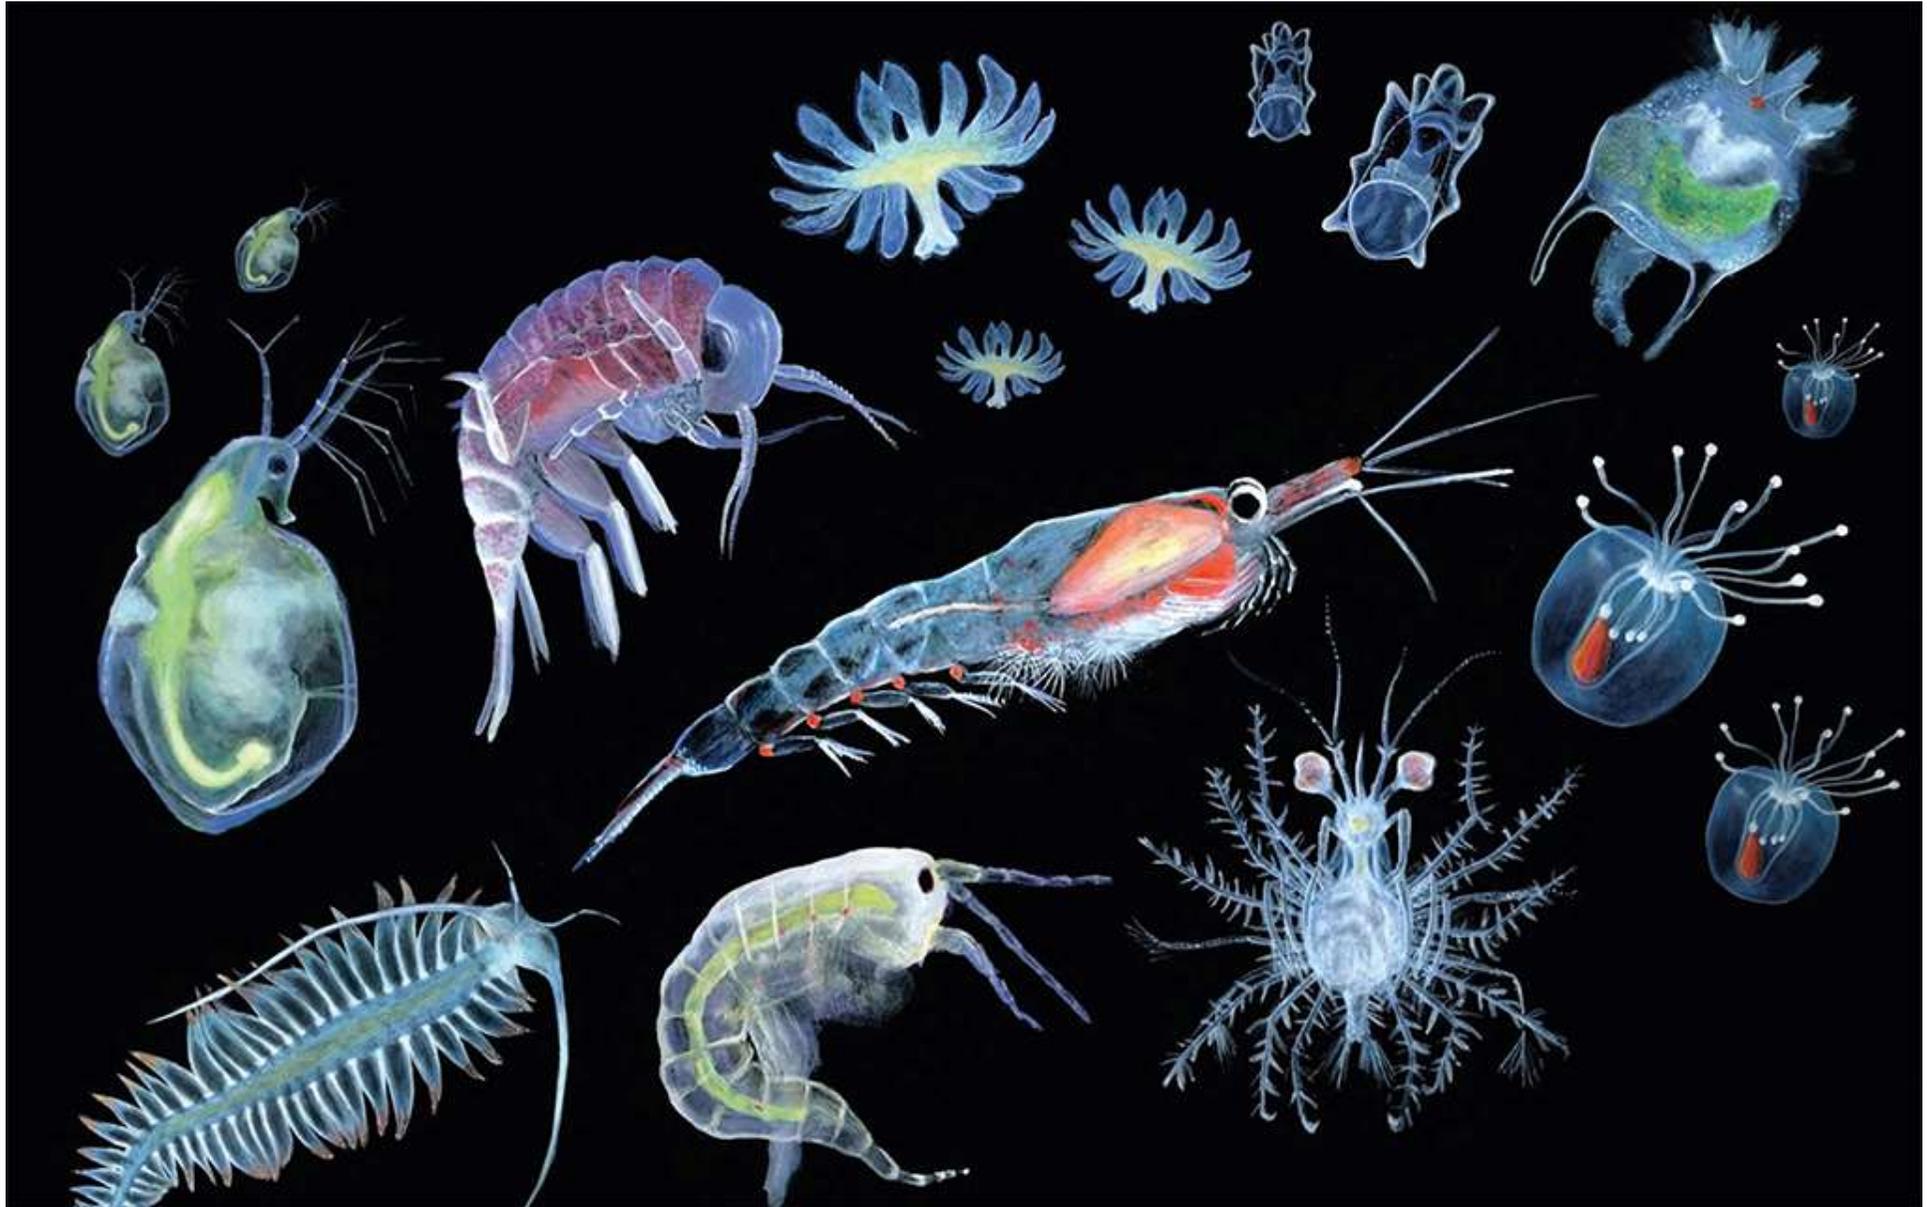

- most widespread
- the most diverse
- the most numerous

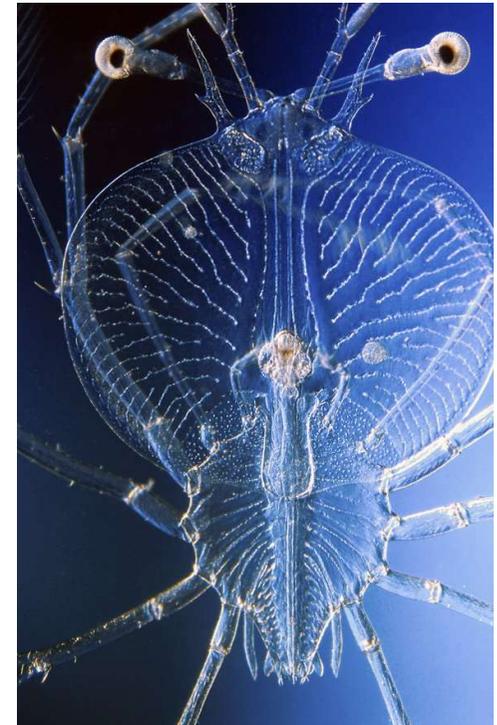

The biomass of only one species of Antarctic krill - *Euphausia superba*, is estimated at 500 million tons, which is far more than any representative of Metazoa, thus competing with all the ants in the world.

HOLOPLANKTON

MEROPLANKTON

They conquered the mainland!!!

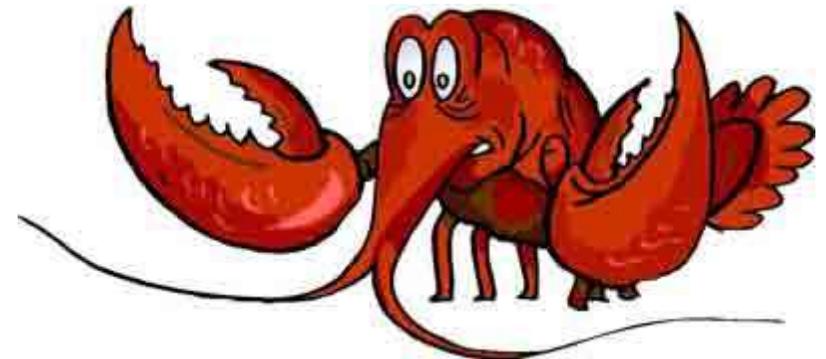

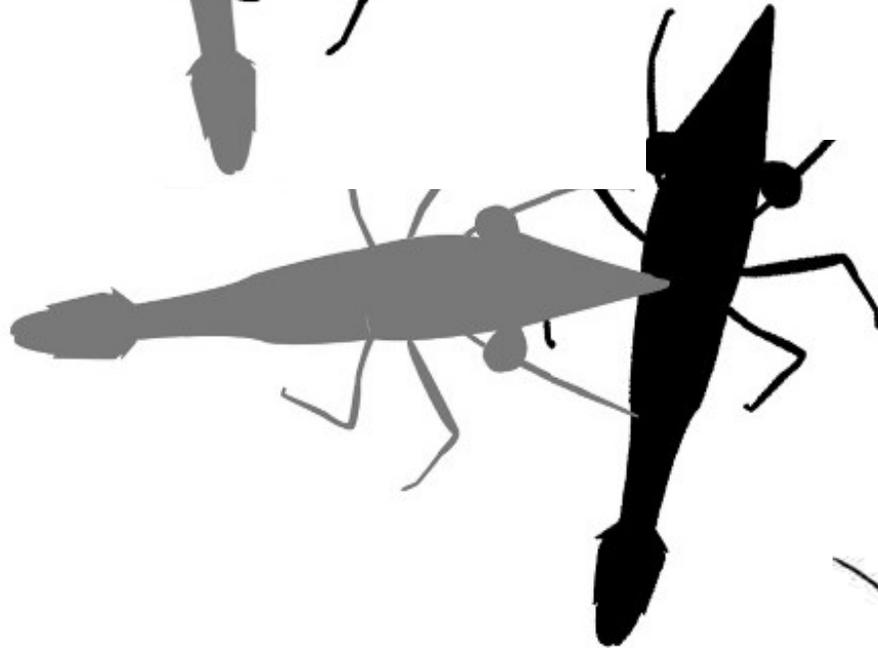

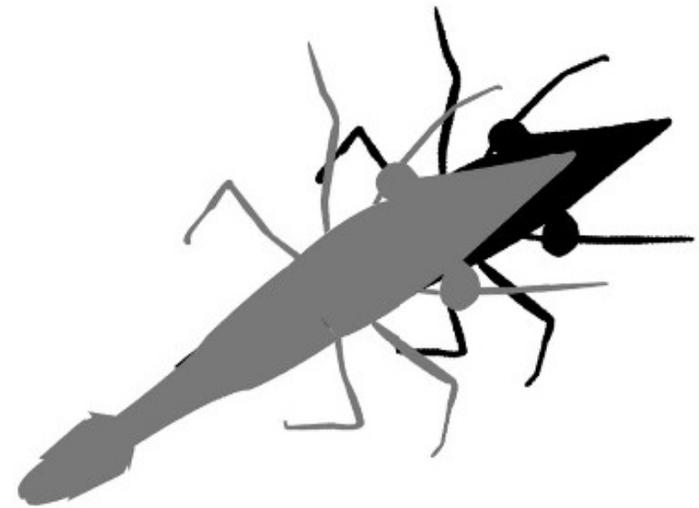

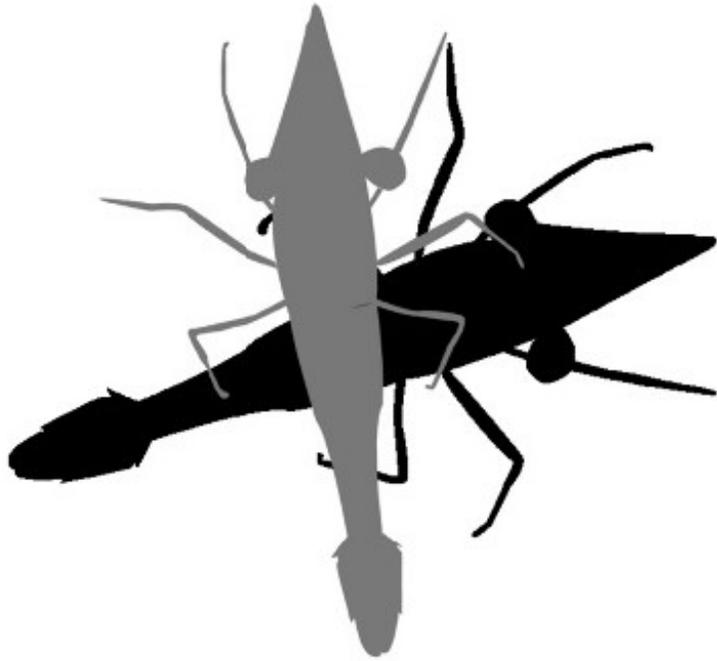

WHO ARE THE MOST SUCCESSFUL LAND CONQUERORS?

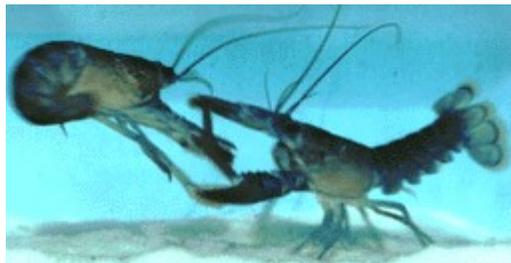

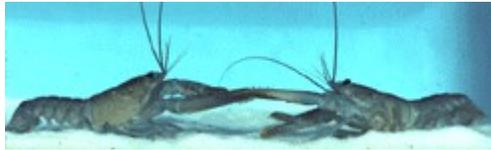

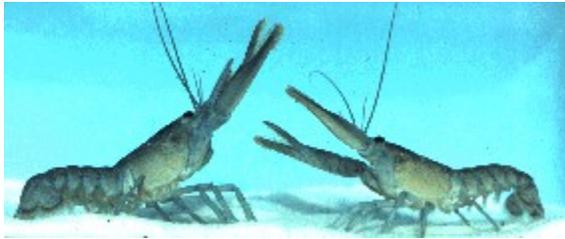

commonly known as pill bugs (*Isopoda terrestria*)

social life, courtship,...?

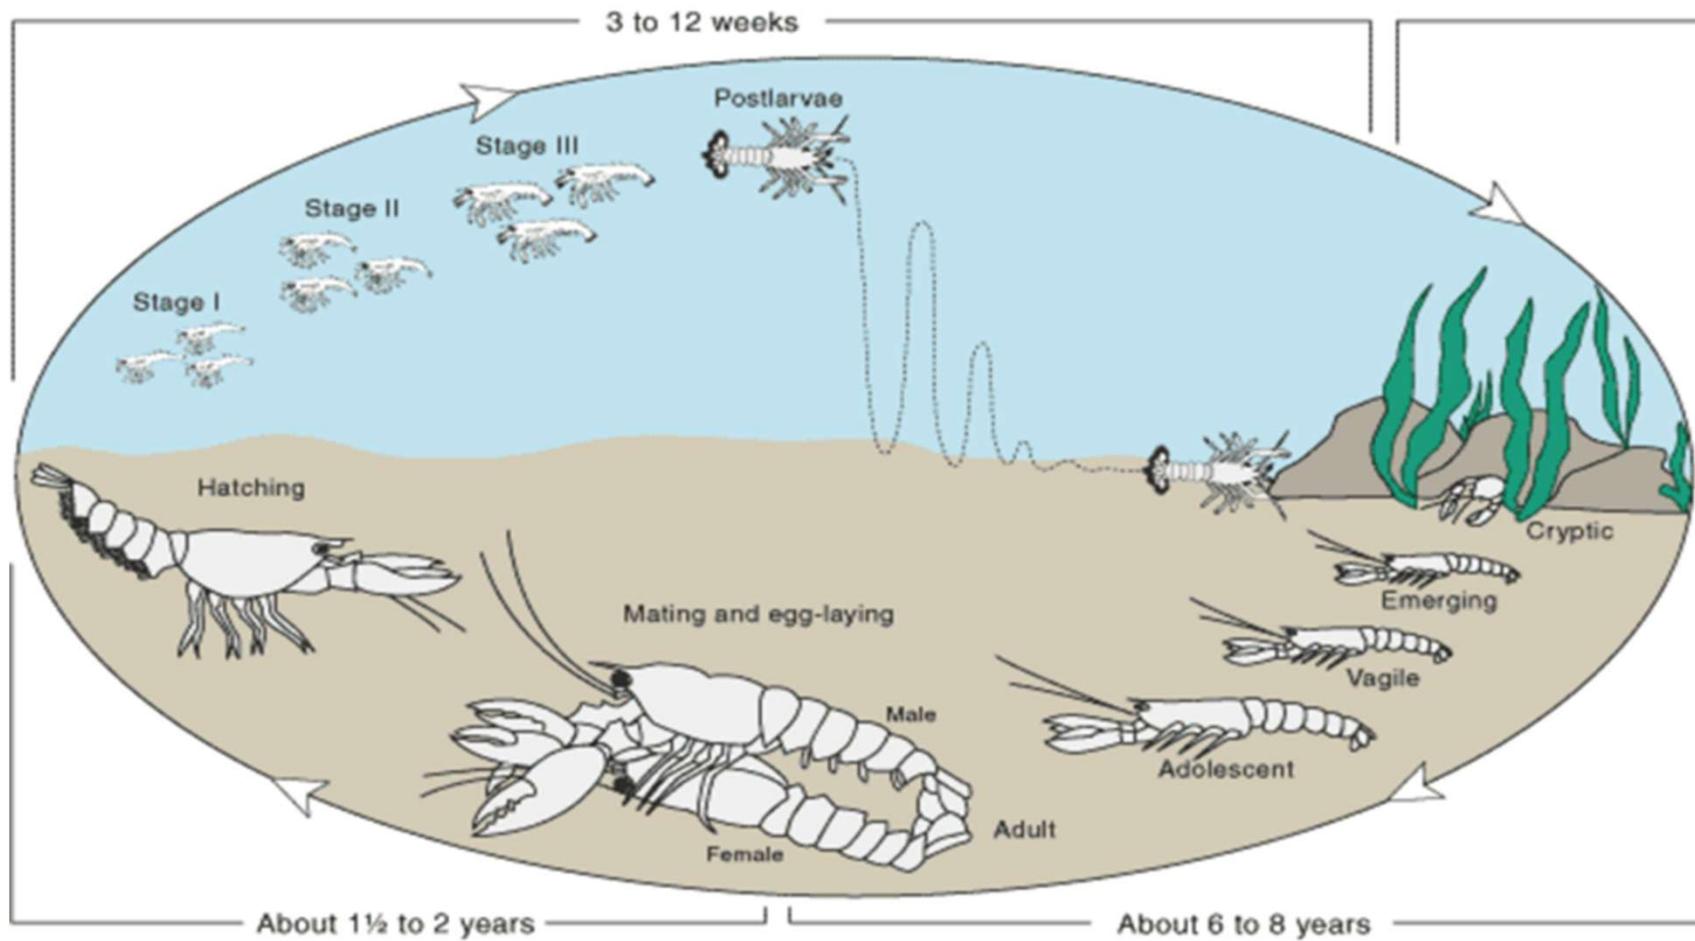

PEACEMAKERS vs WARRIORS

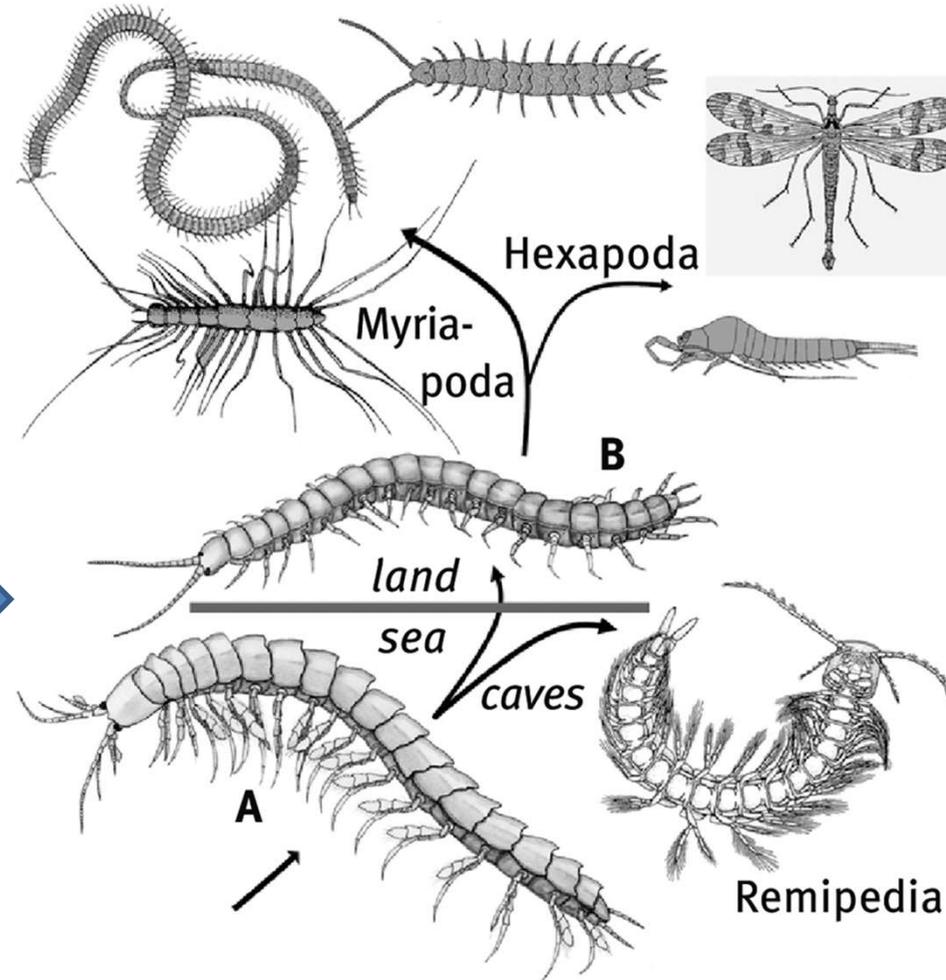

“I will cut you man!!!”

LIFE HISTORY vs LIFE CYCLE

HEXAPODA vs. CRUSTACEA

ORDER REMIPEDIA

ATTRACTIVE, FAST, STRONG, SHARP EYE,...

- ❖ Mantis shrimp hold the title for the fastest punch in the animal kingdom—powerful enough to break seashells and aquarium glass.
- ❖ They also boast some of the world's most complex, extraordinary eyes. Human eyes have three kinds of light receptor cells, but these shrimp have a dozen, allowing them to sense properties of light invisible to other animals.

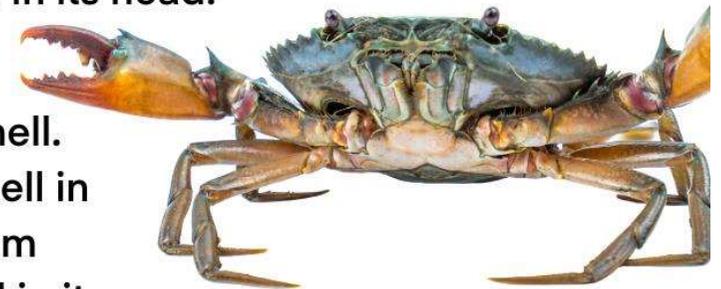

STOMATOPODA

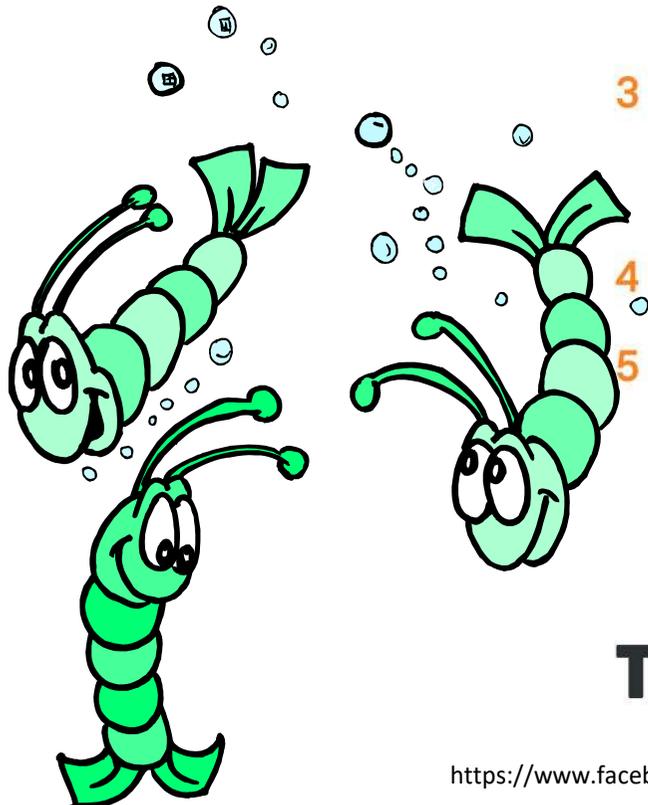

5 REASONS WHY CRUSTACEANS ARE COOL

- 1 Some crabs, disguise themselves by attaching living things, such as anemones, to their bodies
- 2 The pistol shrimp can deliver an explosive attack at predators hotter than the surface of the sun, and loud enough to rupture a human ear drum!
- 3 The Pea Crab is the smallest known species. It measures between 0.27 and 0.47 inches long...about the same as a pea!
- 4 A shrimp's heart is located in its head!
- 5 In order to grow larger, crayfish must shed their shell. They usually eat the old shell in order to recover the calcium and phosphates contained in it
